Careers in the AI Era

What it actually takes to get placed and stay ahead

NAGARAJ P, CO-FOUNDER | QUADRASYSTEMS.NET (INDIA) PRIVATE LIMITED

Most graduates enter the job market with the same hope: that their degree is enough. For most of the last two decades, it was a reasonable bet. It is not anymore.

The companies hiring today are not asking whether you know AI exists. They are asking whether you have already used it to do real work. That distinction is filtering candidates before interviews begin.

The 3 Skills That Get Students Placed and Promoted

Based on 25 years of hiring, onboarding, and growing technical talent at Quadra.

01 Prompt Literacy

Knowing how to ask the right question — every time

Most students use AI like a search engine: type a question, take the output. That is not a skill. It is luck dressed as productivity. The students who stand out have grasped something simple: AI output quality is entirely determined by input quality.

Prompt literacy is the entry-level skill of the AI era. Almost no fresh graduate arrives with it yet. That gap is your opening.

The GCC Framework — use this for every AI interaction:

Letter	Stands For	What It Means
G	**Goal**	Define exactly what you need the AI to produce. Not 'summarise this' — but 'summarise this in 5 bullet points for a non-technical reader.'
C	**Context**	Give the AI information it cannot infer. Your role, your audience, the constraints it must work within.
C	**Criteria**	Specify what good output looks like. Format, length, tone — what to include and what to exclude.

02 Workflow Thinking

Seeing what should not be done by a human

Companies are not hiring people to execute routine steps faster. They are hiring people who can redesign those steps entirely. This is not a technical skill — it is a design mindset. It is teachable. Almost no fresh graduate arrives with it.

- **Identify the repetitive.** In any process, find the steps that follow a consistent pattern. These are candidates for automation.
- **Separate judgment from execution.** Formatting, retrieving, summarising — automatable. Deciding, advising, creating strategy — not yet.
- **Redesign, not just accelerate.** The question is not 'how can AI help me do this faster?' It is: 'if AI handles this step, what does the process look like now?'

> When Quadra introduced AI tools internally, we did not mandate adoption. We showed employees what the tools could remove from their day. When someone sees AI eliminating a task they dislike, curiosity replaces resistance — every time.

03 Human Judgment in the Loop

The rarest skill — knowing when the AI is wrong

AI makes it easy to produce volume. What remains scarce is the judgment to know when the output is wrong, incomplete, or context-blind. An AI summary may be factually accurate and still miss the subtext of the situation it describes. A candidate who catches that gap is worth ten who submit AI output as final.

- Always read the full AI output. Look for missing context, false precision, or generic claims dressed as insights.
- Ask: 'What does this output not know about our specific situation?' That gap is your contribution.
- Document your corrections. A portfolio of improved AI outputs is stronger evidence than a certificate.

5 Actions Any Student Can Start This Week

> "The candidates we pass on are rarely weak technically. They are weak on communication, ownership, and the ability to ask a good question. AI has made the syntax irrelevant. The thinking is still entirely human."

01

Automate one task you already do

Pick something you do every week — summarising lecture notes, drafting emails, preparing for a presentation. Use an AI tool to handle it end-to-end once. The moment you experience time saved personally, adoption becomes natural. This is not about AI in the abstract. It is about your specific day getting easier.

02

Earn one cloud certification — free

Microsoft SC-900 (Security Fundamentals), AZ-900 (Azure Fundamentals), and Google Cloud Digital Leader all have free learning paths completable in 2–4 weeks. Companies hiring for cloud-adjacent roles screen for them. Most candidates in your cohort will not have one. You can.

03

Practice the GCC Framework for 30 days

Apply Goal → Context → Criteria to every AI interaction for one month. Keep the prompts that worked. The difference in output quality is visible within a week. At the end of 30 days, you have a personal prompt library that reflects your discipline and domain knowledge.

04

Document one AI-solved problem

Write one paragraph: the problem you faced, the AI approach you used, and the result. Not 'I used ChatGPT.' A structured problem–approach–outcome entry is a portfolio item. Most candidates arrive with zero AI proof of work. This single entry puts you ahead of the majority.

05

Follow three practitioners, not three companies

On LinkedIn, follow people who are building and solving problems — engineers, architects, founders. They share what they are struggling with and learning in real time. Companies share announcements. The practitioner feed builds industry instinct in months. The company feed does not.

The Long Game

Build a career that compounds — not just a first job.

At Quadra, we have colleagues who have been with us for 15 years, 20 years and 25 years. They were not the most technically brilliant people we hired. They stayed curious. They stayed honest. They grew with every role they took on — and in some cases, ahead of it.

Quadra Tagline: Technology evolves fast, fortunately we are faster.

That is the career worth building. Not the fastest start. The longest run.
